03 GENERAL APPLICATION GUIDELINES

Creska™ can be used anywhere where fat or skin naturally exists and can be administered via subcutaneous injection or applied topically.

Creska™ works best in combination with many established PRP protocols and was created on the premise that adding younger cells and proteins to aging populations in combination with autologous signaling from platelet-derived growth factors should enhance regeneration.

Creska™ is an affordable Off-The-Shelf product that should be offered to many PRP candidates.

01 ABOUT CRESKA™

Creska™ offers a homologous “Off-The-Shelf” Adipose Derived ECM that is intended to be used where skin and fat naturally exist and to perform the same basic function or functions of adipose tissue in the recipient as in the donor, such as cushioning.

IMPORTANT INFORMATION:

Creska™ is produced in the United States by an FDA registered lab that is currently conducting multiple FDA-approved clinical trials in the regenerative medicine industry.

02 HOW CRESKA™ WORKS

Creska™ is derived from dermal adipose tissue, which is classified as skin. It's a homologous Adipose Derived Allograft that behaves in the skin as it was naturally intended to perform.

The intent is to aid in the structural support of damaged tissue while working homologously with natural functions.
